Install Instructions

If you don't know, how to install an extension in LibreOffice, see our http://www.libreoffice.org/assets/Uploads/EN_Documents/Installingextensions.pdf about installing extension for detailed instructions.

Project Description

Read Text Extension lets an external program or web application read text from Writer, Calc, Draw, Impress, Web Writer or the system clipboard. If you use it to read text aloud, it can help you to edit your writing or to compare your document's text with a printed document. If you use it with a web application, you can translate your text to another language or check punctuation and grammar. It can help you to learn a new language or to find out how to say words you do not know. To use it, highlight some text. If you are using the word processor or the HTML editor, you can highlight several selections by holding down the Control key. When you have highlighted some text, select *Tools - Add-Ons - Read Selection* or click the *Read Selection* button on the tool bar. To read the system clipboard, select *Tools - Add-Ons - Read clipboard*.

If you can't read the screen easily, consider a system-wide accessibility solution for [Apple OSX](#), [Gnome](#), [KDE](#) or [Microsoft Windows](#). If you have installed a system-wide accessibility solution, and it is activated, then you might not need this extension to read text aloud. You can use the Read Text Extension to read using a different language or voice, to save speech as an audio file, or send the text to a web application.

The Read text extension uses temporary files to send information to external programs. Depending on the security set up of your computer, other users or programs might be able to read the contents of files that the extension or other external programs produce. If you are concerned about privacy, launch this add-on again with no text selected to replace the temporary file that contains the text you want to remain confidential. The paths and names of any temporary files directly created by the extension are shown in the Command and Script areas of the *About...* dialog.

Built-in speech synthesis

Read Text extension uses your computer platform's built-in speech synthesis application by default. For example, Linux uses *espeak*. Apple OSX uses *say*. Windows uses the system's *SAPI5* voices. A Windows computer can read with a different voice or language if you install an additional SAPI5 voice.

External Programs

External programs can give your computer the ability to use different languages or voices. To use text to speech with a command-line based speech synthesis program like Festival or eSpeak on your computer, you may need to install extra speech files for your language and dialect.

Next Steps

Next Steps - Migration

- ▼ Content of the current websites:
 - ▼ Transformation needed
 - ▼ New content types
 - ▼ Fewer content types
 - ▼ Python-Script / Transmogrifier / manual
- ▼ History / Portal Catalog (Indexes etc.)
- ▼ Members/User:
 - ▼ Export / Import within Plone or
 - ▼ Python-Script

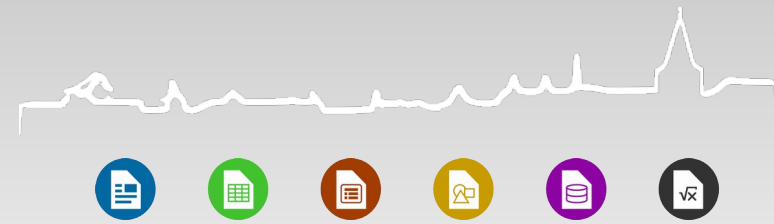

Next Steps - Multilingual

- ▼ Add more Languages
- ▼ Content Types are multilingual enabled
- ▼ Move site content to language folder
- ▼ Translate content

Next Steps – Website Design

- ▼ New Diazo-Theme:
 - ▼ Static HTML-File
 - ▼ CSS-File
 - ▼ Images
 - ▼ Rules-File (dynamic connection)

Next Steps – Website Design

Modify theme LibreOffice-Extensionssite
