

Interoperable Office Collaboration

Svante Schubert

Svante.Schubert@gmail.com

TIRANA | 26 Sept. 2018

Question: Will Libreoffice in 50 years be still our favorite editor?

Answer:

Depends if **LibreOffice** will support the **state of the art features** in 50 years!

Bold Claim:

"Collaboration" the most critical feature in our connected world

> Everyone of us has at two computer at least! -- laptop and smartphone!

Feature: Collaborative real-time editor (2 modes) 1) Real-Time Mode (e.g. Etherpad, Google Docs, etc.) Users can edit the same document simultaneously.

2) Non-Real-Time Mode (similar revision control systems) Users edit a copy of document and merge later.

https://en.wikipedia.org/wiki/Collaborative_real-time_editor

Feature:

Collaborative real-time editor (2 modes) In the end all "copies" are the same!

1) **Real-Time Mode** Automatic fix of merge conflicts! (for convenience).

2) Non-Real-Time Mode Merge conflicts have to be resolved by the user!

Merge conflict like I am editing a cell, YOU delete the table!

Feature:

Collaborative real-time editor (2 modes)

 Real-Time Mode Good for working with a group of trusted members.

2) Non-Real-Time Mode Users like to be in control of all changes. Legal departments of two companies collaborating.

Feature:

Collaborative real-time editor (2 modes)

1) **Real-Time Mode** Comes first to mind!

2) Non-Real-Time Mode Often forgotten! But IMHO most money is here!

How do real-time editors work?

No documents are dispatched!
 Dispatching documents is stupid!!!
 As stupid as developers sending software repos!

Sending changes / operations / differences / DIFFs!
 Best not text/syntax based, but semantic changes!

Today's Problem

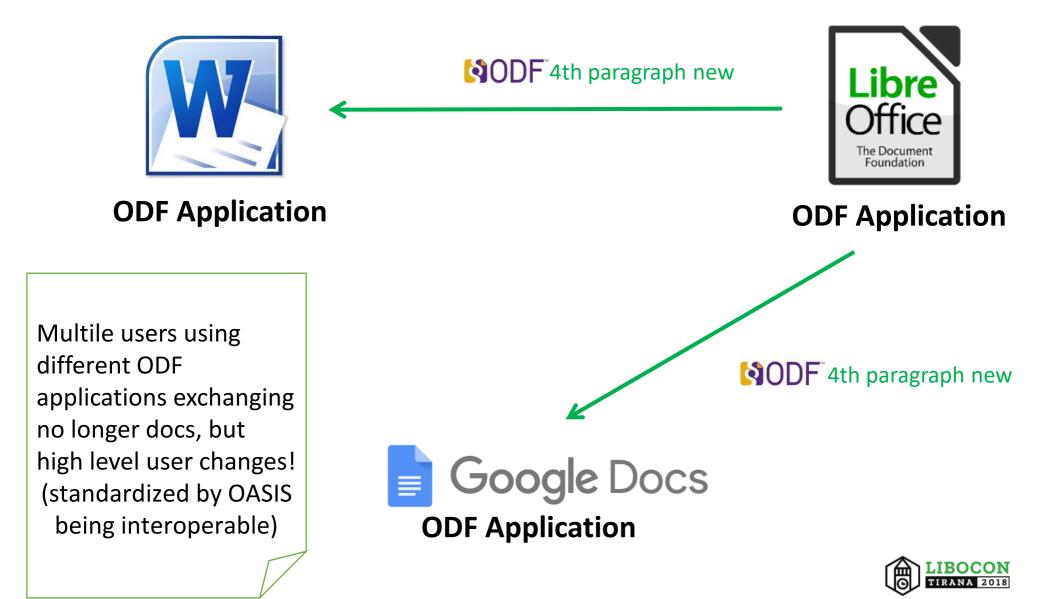

The most important question in collaboration: "What have you changed in the doc?"

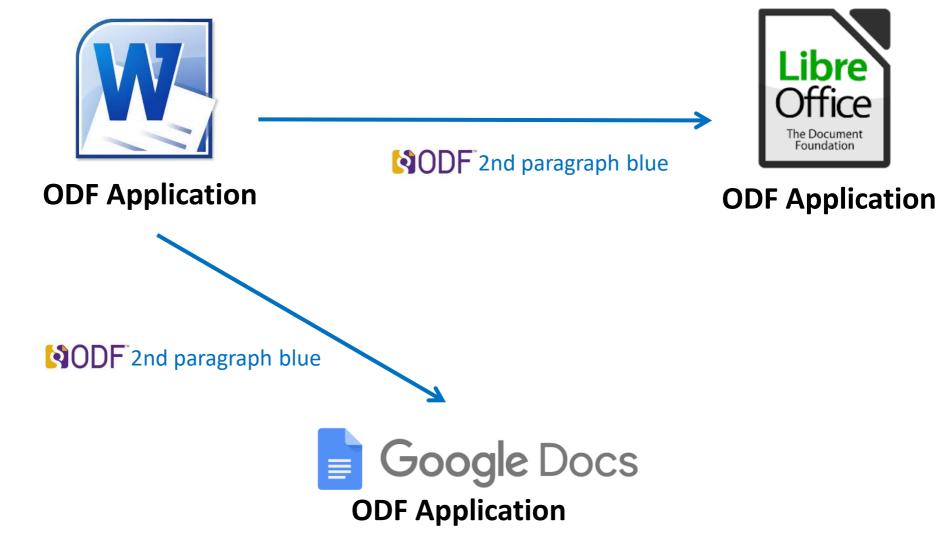

No way to answer in an interoperable way! Only standards for file formats exist! No standard for file changes!

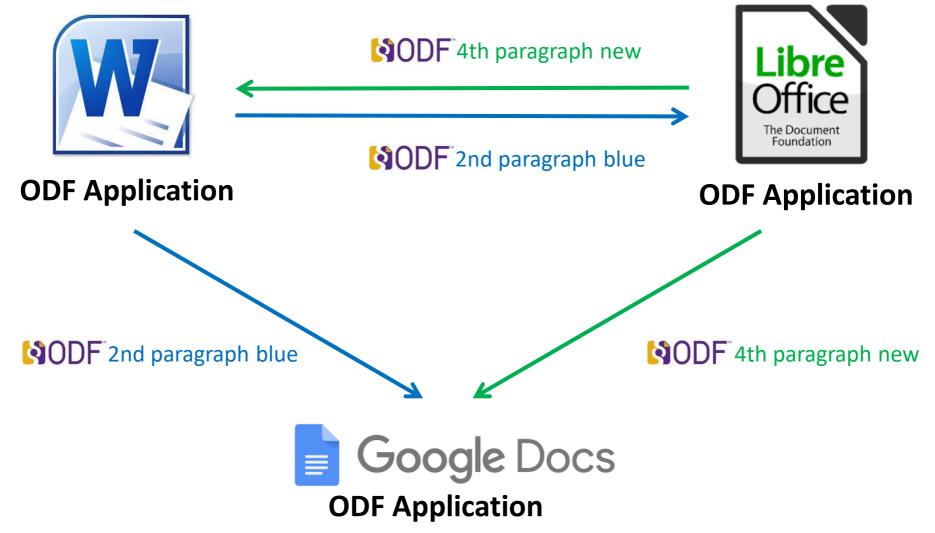

How the Future might look like...

Are ODF Changes able to become a Standard?

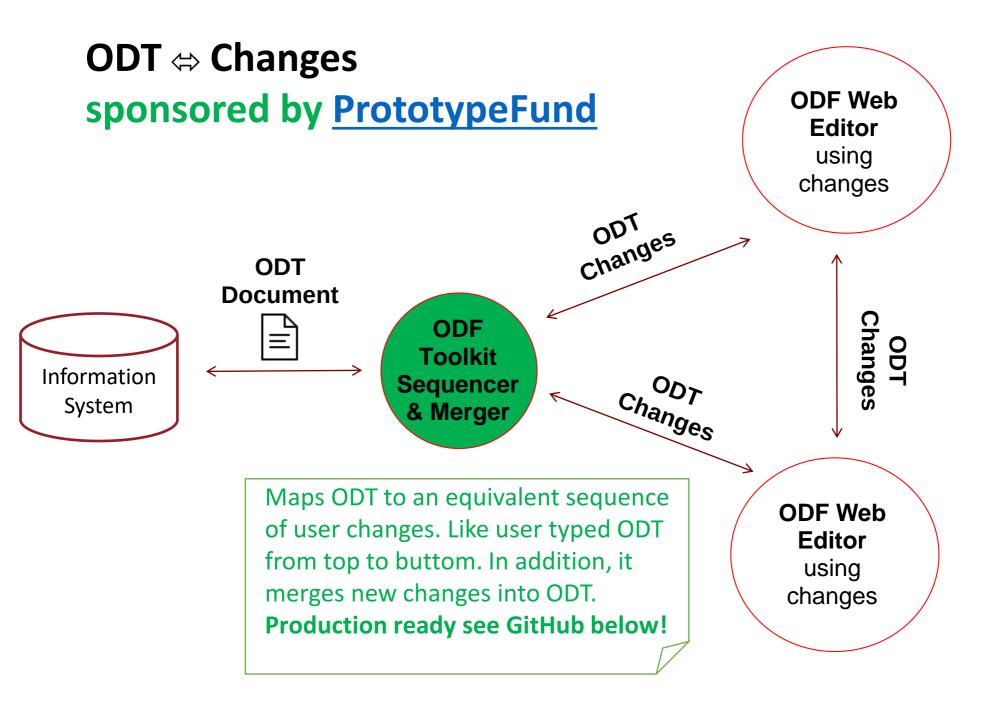

ODF Changes are de-facto Standard...
As all office application I am aware of...
a) Know the same user objects (table, paragraph..)
b) Allow similar user changes (add, modify, delete ...)

Just specifying what is already on our minds...

How about a Prototype on ODF Changes?

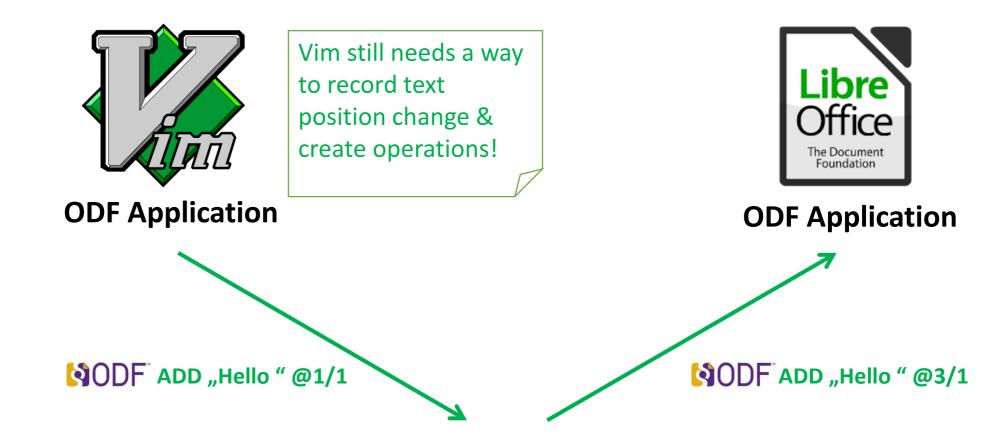

See https://github.com/svanteschubert/odftoolkit/tree/odf-changes/odfdom

How about a Prototype an end user can use!?!

Exchanging ODF Changes

ODF Feature Bridge

"Feature bridge" adds/removes changes of unsupported ODF features and adopts positions (OT), see above for LO has same change at 3rd, while VI at 1st position.

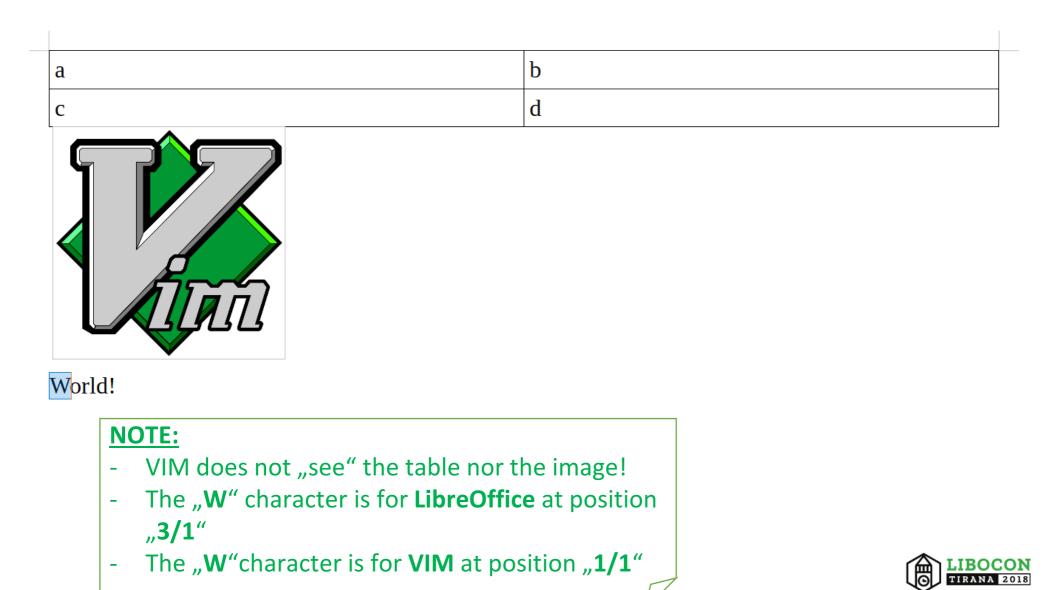

Full Semantic Tree

Exchanging ODF Changes

Semantic tree:

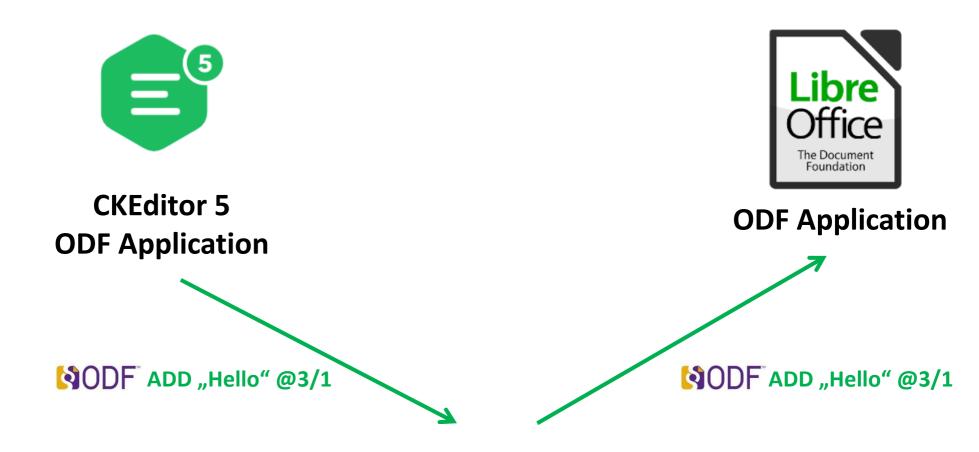

The underlying XML tree is being mapped to larger logical pieces represented as Semantic Tree. Changes refer to those user objects.

Vim is <u>exciting</u>! More thrills pls!!

Exchanging ODF Changes

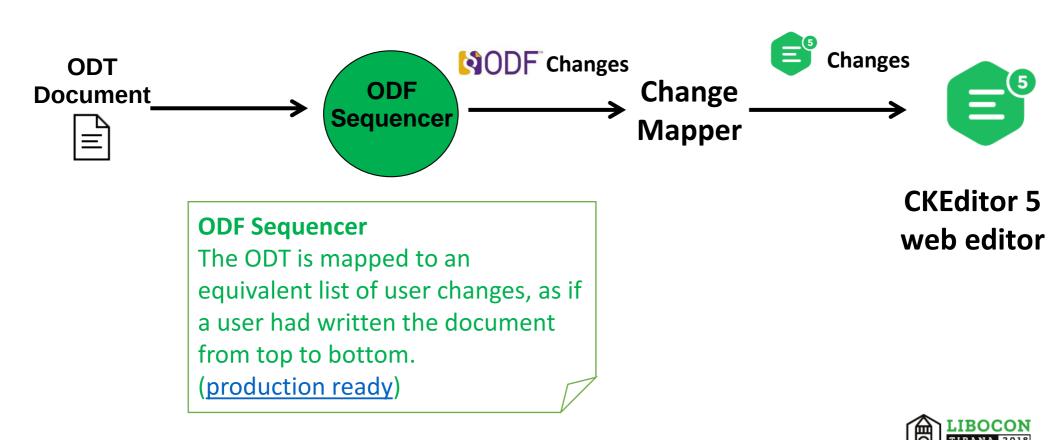

ODF Feature Bridge

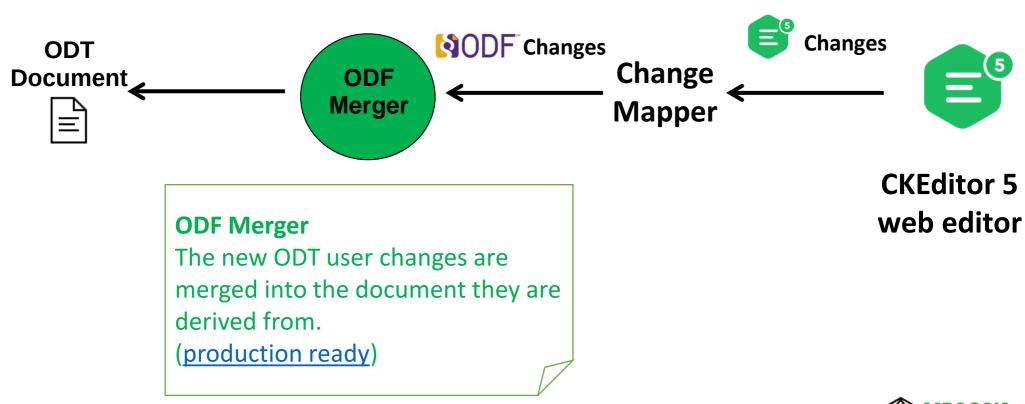

"Feature bridge" not only adds/deletes changes, but maps them to other "change dialect". (more detailed view on next 2 slides)

Proof of Concept Load ODF Text into CKEdit5

Proof of Concept Save ODF Text by CKEdit5

Proof of Concept misses from CKEdit5:

a) Loading "CKEdit5 changes" from JSONb) Saving new changes as "CKEdit5 changes" in JSON

Could someone help me with this, pls?!? Thx in advance & cheers, Svante

Resources on CKEdit5 Changes

- <u>here</u> you will find all operations, with the inline documentation in the code

- here is the current version of the transformation (OT) code

 here you will find the engine debug plugin, which might be useful for debugging your code; all you need to do is to enable this plugin the same way you enable any other plugin and you should get some additional debug methods

- here you will find Operation Replayer; CKSource use it for debugging purposes to recreate the state of the model based on the recorded operation history (AFAIK not often recently used by CKSource)

- using "apply operation" event and method you should be able both record all operations applied to the document and apply your operations

What we learned so far:

Dispatching semantic changes is most efficient..
 - Changes are mandatory for merging

- No longer heuristics required to find changes
- Semantic provides best interoperability

2) Changes perfect to bridge different feature sets of applications

New benefits (1/2)

- Save using Changes:

- No Data loss by "Filters" overwriting unknown features
- Faster, as only new changes are merged
- Transparency No fear of incidental overwriting data
 - e.g. famous author receives change-request from reader

Key example: The read-only ODT of the famous author is accessible by changes counting positions. If instead we would use explicit IDs for position it would require to have an ID on all possible referenceable element blowing up the document size with IDs (boilerplate). **Convention over configuration!**

New benefits (2/2)

- Run Time API across applications (based on semantic tree)
 - Browsers have Run Time API by W3C DOM
 - Semantic Tree is like a typed DOM ;-)

Trustworthy automated feature tests
 Now: "Load doc" & "save doc"
 No proof, e.g. an array would support all ODF features

Future: "Load doc", "change feature" & "save doc"

Q: ODF Run Time API? What is it good for?

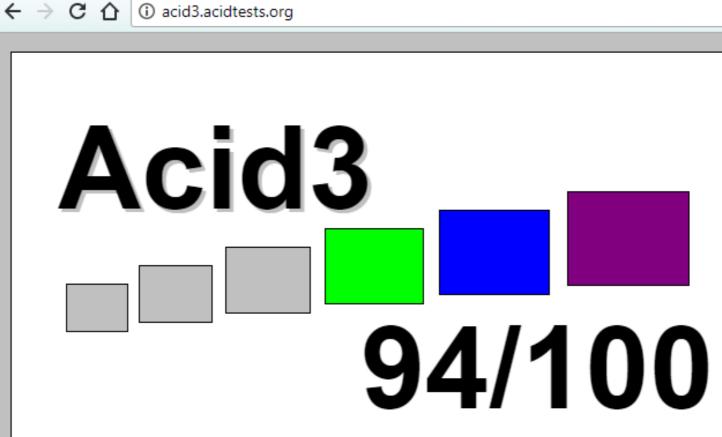

A:Take a look at the browsers!

A: Interoperable Macros, similar JavaScript in Browsers!

Out of the box testing:

To pass the test, a browser must use its default settings, the animation has to be smooth, the score has to end on 100/100, and the final page has to look exactly, pixel for pixel, like <u>this reference rendering</u>.

Documentation on feature support:

Further benefits (1/2)

 Not only identifying the feature of applications: Also possible to **identify** the <u>features of customer documents</u>

Further benefits (2/2)

- Git support for ODF documents
 Overwrite GIT using semantic diffs instead of line based diffs.
 Standardized ODF changes the result of a comparison of two document!
 Merge will be so easy!!

Before you can understand: "Miracle of Merge"...

BASIC TECHNIQUES

The 1 x 1 of Changes / Operations

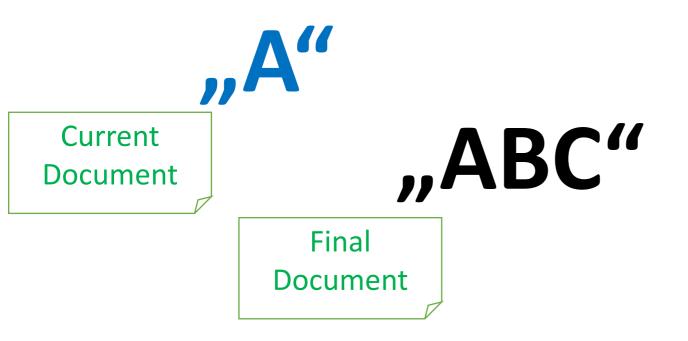

Final Document

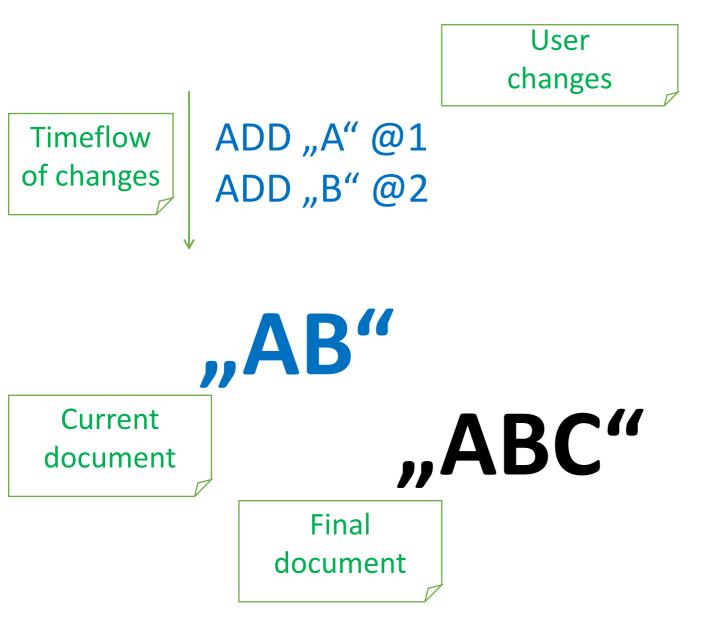

ADD "A" @1

ADD "A" @1 ADD "B" @2 ADD "C" @3

"ABC" "ABC"

Different user changes

ADD "A" @1 ADD "B" @2 ADD "C" @3

ADD "C" @1

"C" "ABC"

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "C" @1 ADD "B" @1

"BC" "ABC"

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "C" @1 ADD "B" @1 ADD "A" @1

"ABC" "ABC"

ADD "A" @1 ADD "B" @2 ADD "C" @3

ADD "C" @1 ADD "B" @1 ADD "A" @1

QUESTION: How transforming one into the other?

"ABC"

Move C change from top to bottom

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "C" @1 ADD "B" @1 ADD "A" @1

"ABC"

Position of C changes as B was inserted now earlier, when the two changes are being switched!

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "B" @1 ADD "C" @2 ADD "A" @1

"ABC"

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "B" @1 ADD "A" @1 ADD "C" @3

"ABC"

Move B change from top to middle

ADD "A" @1 ADD "B" @2 ADD "C" @3 ADD "B" @1 ADD "A" @1 ADD "C" @3

"ABC"

"ABC"

Now both list of changes are identical!

ADD "A" @1 ADD "B" @2 ADD "C" @3

ADD "A" @1 **ADD "B" @2** ADD "C" @3

We might call the blue list normalized!

Change Deletion

Can we delete B by just removing the change?

ADD "A" @1 **ADD "B" @2** ADD "C" @3

ADD "A" @1 **ADD "B" @2** ADD "C" @3

"АВС"

Change Deletion

NO! A gap is in the positions, which is not allowed!

ADD "A" @1 **ADD "B" @2** ADD "C" @3

ADD "A" @1 ADD "C" @3

"А₿С"

Change Deletion -Only remove top (last) change!

"ABC"

ADD "A" @1 **ADD "B" @2** ADD "C" @3 ADD "A" @1 **ADD "B" @2** ADD "C" @3

> B not on top, not the last change being made, therefore B influences C

Change Deletion -Only remove top (last) change!

ADD "A" @1 ADD "C" @2 **ADD "B" @2** ADD "A" @1 ADD "C" @2 ADD "B" @2

> B last change, influences to C were removed by OT (see URL)

OT:

http://www.codecommit.com/blog/java/understanding-andapplying-operational-transformation

"**ABC**"

Change Deletion -Only remove top (last) change!

"AC"

ADD "A" @1 ADD "C" @2

Removes B and keep changes normalized. ADD "A" @1 ADD "C" @2 **ADD "B" @2** DEL "B" @2

> Add inverse operation and keep all changes.

USER A ADD "Hello" @1

"User A" works on a branch (similar GIT branch concept) offline (e.g. sailing)

Server state of ODT both user branched from

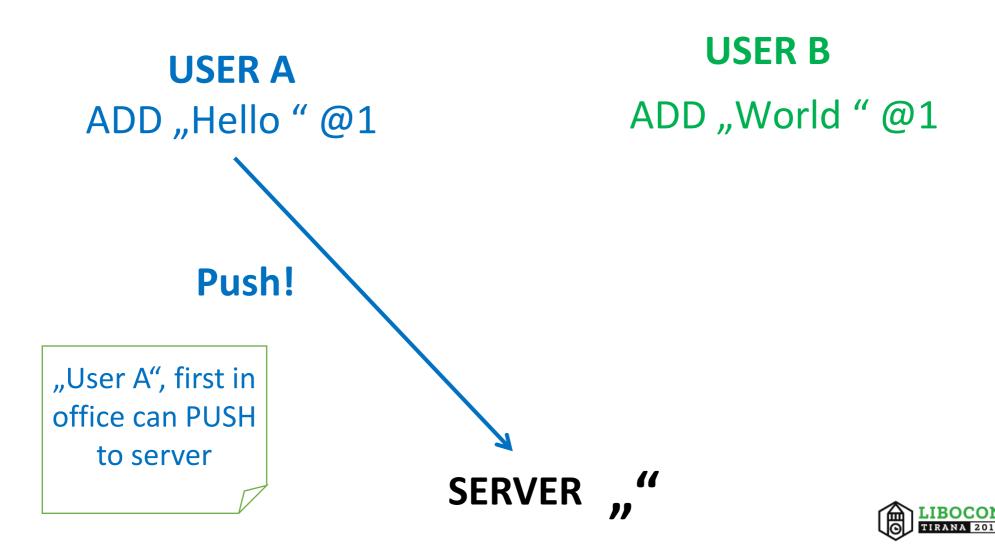

SERVER

"

USER B ADD "World" @1

"User B" works over week-end offline on own "git-like branch". (e.g. woods)

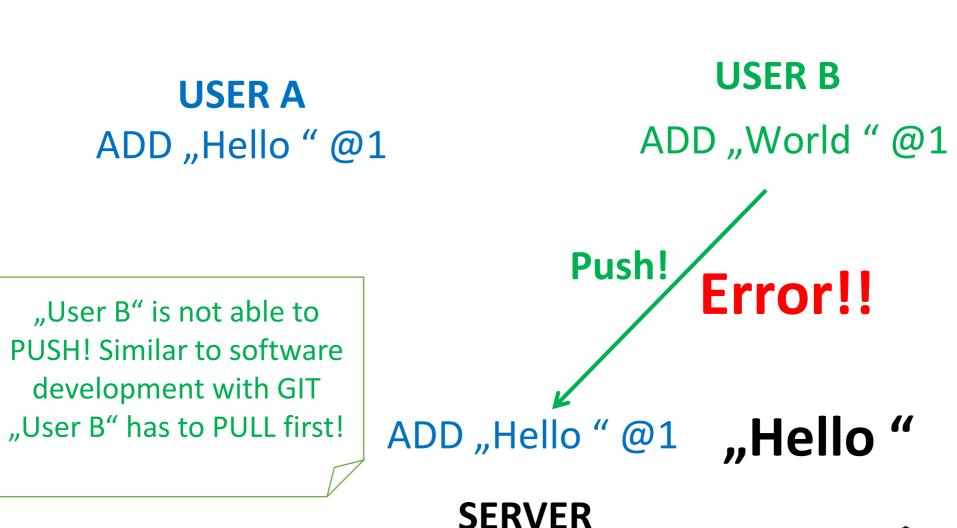

USER A ADD "Hello" @1

USER B ADD "World" @1

Server state being adapted with branch of "User A"

ADD "Hello" @1 **"Hello"** SERVER

LIBOCON TIRANA 2018

USER A ADD "Hello" @1

USER B ADD "World" @1

User B pulls the change(s) being added earlier by "User A" to its own branch.

USER A ADD "Hello" @1

USER B ADD "World" @1 ADD "Hello" @1

Changes of "User A" had happened BEFORE the changes of "User B" and need to be moved to start of the change list, applying OT while moving.

ADD "Hello" @1 **"Hello"** SERVER

LIBOCON TIRANA 2018

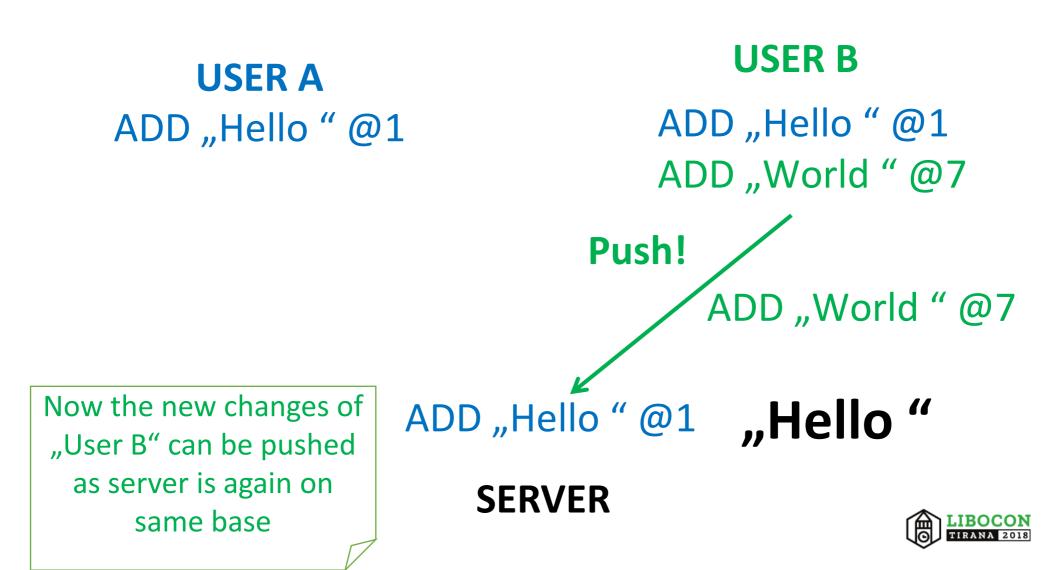

USER A ADD "Hello" @1

USER B ADD "Hello" @1 ADD "World" @7

Position changes by OT from 1 to 7 due to the length of "Hello"

ADD "Hello" @1 **"Hello"** SERVER

USER A ADD "Hello" @1

USER B ADD "Hello" @1 ADD "World" @7

NOTE: If "User B" would have pushed first ODT would be "World Hello "

ADD "Hello" @1 ADD "World" @7 **"Hello World"**

Q: How do we identify documents (in GIT)?

A: Hash their Semantic Tree not the Syntax!

Get rid of "ODF XML syntax" changing noice, breaking hashes identifying ODT documents in GIT!!

Semantic tree:

The underlying XML tree is being mapped to larger logical pieces represented as Semantic Tree. Changes refer to those user objects.

Q: How start the Collab feature in LibreOffice? Q: What is the Minimum Viable Product (MVP)?

LO Collaboration (MVP)

Modern ping pong

ODF Application

ODF document (signed)

ODF Application

NOTE:

Not the ZIP of the ODT is being signed, but each XML file within the ZIP Like ancient wax seals, if you would change the content the seals break..

But what if someone would like to suggest a change on a signed document?

LO Collaboration (MVP)

Modern ping pong

+ **NODF** changes (signed)

ODF Application

ODF Application

- Suggested changes could be saved within the ODT ZIP as a new file, pointing to the content!
- By this the XML sign of the content.xml file would not be broken!
- New file could be signed as well with the signature of the responding user!

LO Collaboration (MVP)

Modern ping pong

ODF document (signed)

+ **ODF** changes (signed)

ODF Application

+ NODF changes (signed)

ODF Application

- Initial author can still answer by also saving new changes!
- Although all changes will be kept, earlier suggested changes can be removed by adding their inverse change!

LO Collaboration (MVP)

Modern ping pong

NODF document (signed)

+ **NODF** changes (signed)

ODF Application

ODF Application

+ **NODF** changes (signed)

+ **NODF** changes (signed)

 Authentication of every change of any editor in document history is being guaranteed!

When it is so cool, why don't we have it already?

ODF Changes based on ODF XML, which is complex..

ODF XML Grammar

Hard to oversee

```
<define name="table-table">
    <element name="table:table">
        <ref name="table-table-attlist"/>
        <optional>
            <ref name="table-title"/>
        </optional>
        <optional>
            <ref name="table-desc"/>
        </optional>
        <optional>
            <ref name="table-table-source"/>
        </optional>
        <optional>
            <ref name="office-dde-source"/>
        </optional>
        <optional>
            <ref name="table-scenario"/>
        </optional>
        <optional>
            <ref name="office-forms"/>
        </optional>
        <optional>
            <ref name="table-shapes"/>
        </optional>
        <ref name="table-columns-and-groups"/>
        <ref name="table-rows-and-groups"/>
        <optional>
            <ref name="table-named-expressions"/>
        </optional>
   </element>
</define>
<define name="table-columns-and-groups">
    <oneOrMore>
```

ODF 1.2 XML:

- . 598 XML elements
- . 1300 XML attributes
- >18 tsd. lines

Very hard to read by humans and to search within!

ODF XML Grammatik

ODF

Hard to oversee

. . .

```
<define name="table-table">
<element name="table:table">
<ref name="table-table-attlist"/>
```

ODF 1.2 XML:

- . 598 XML elements
- . 1300 XML attributes
- >18 tsd. lines

```
<optional>
```

```
<ref name="text-soft-page-break"/>
```

```
</optional>
```

```
<ref name="table-table-row"/>
```

Let's look only at the <table:table> root element and its children in the ODF XML grammar.

Table root with children

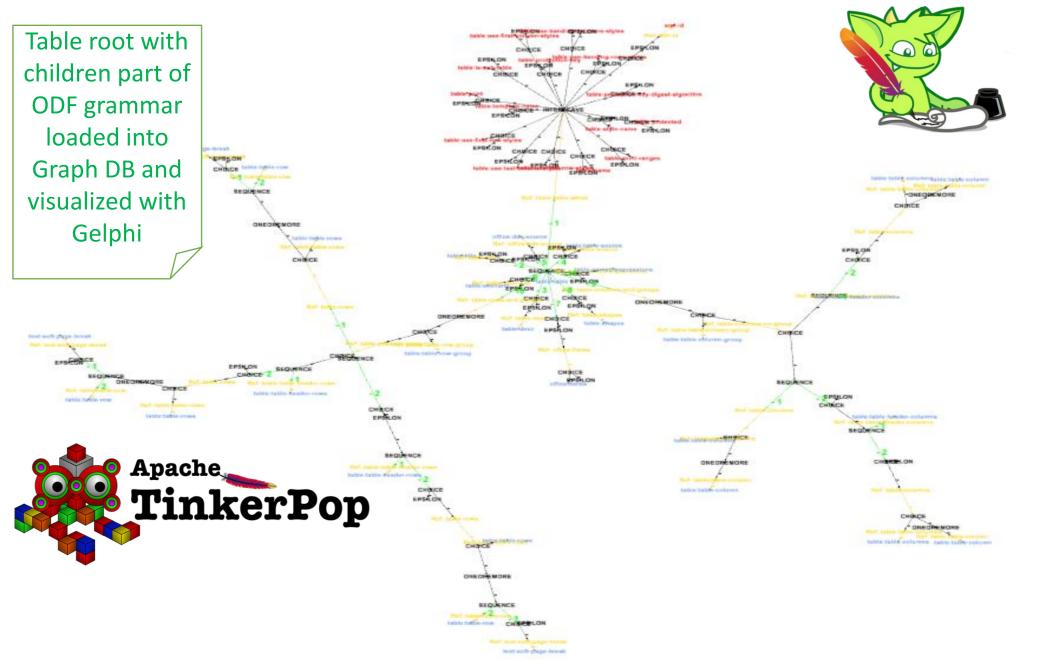

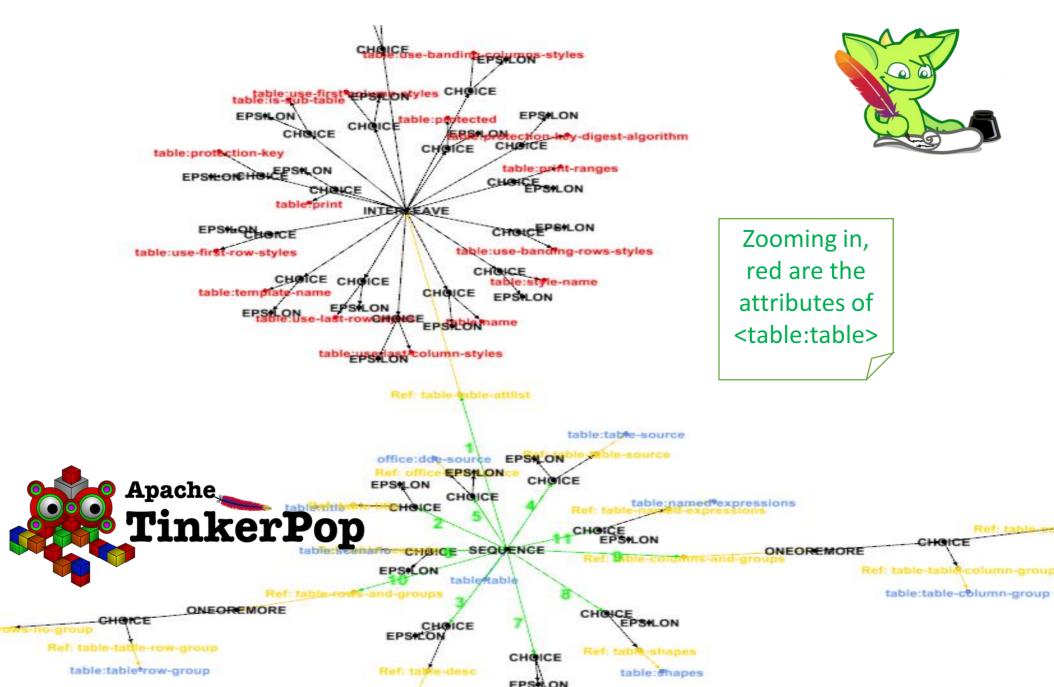

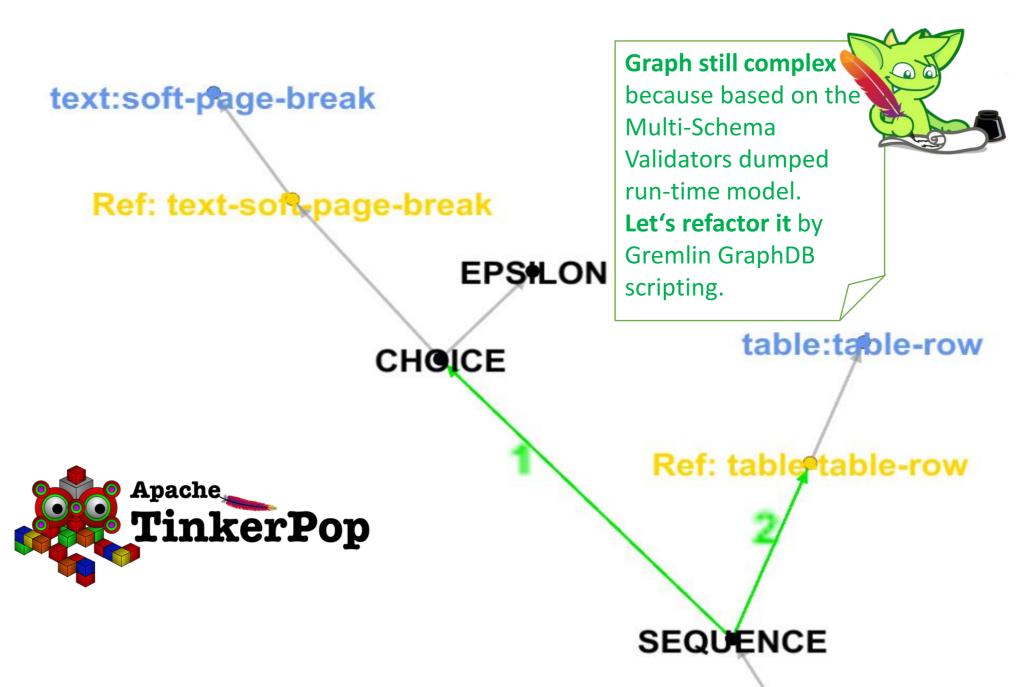

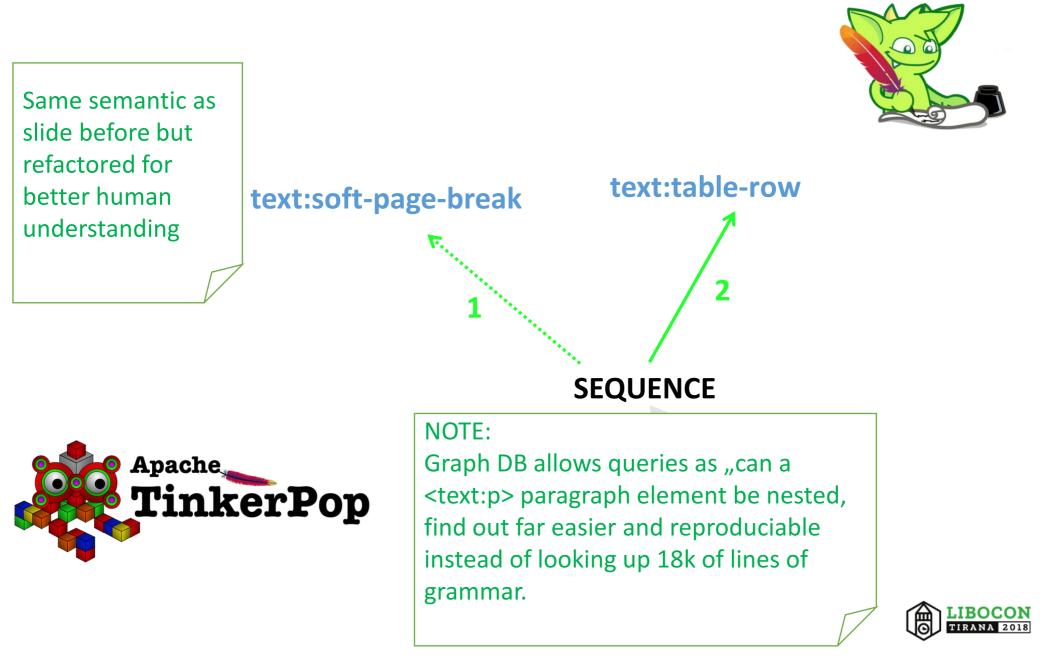

Table root with children

Cumbersome

GOAL & VISION (1/2)

a) Define additional ODF Change info!b) Ease access to ODF XML grammar via Graph DB

GOAL & VISION (2/2)

 c) From above: Generate source code -> ODF RunTimeModel
 d) Let become <u>collab editors</u> as frequent as <u>text editors</u>!

Huge number of ODF XML should be taggled by source code generation. More flexible to create RunTimeModl with for different languages! Or optimization such bitarrays for spreadsheet cells properties.

CURRENTLY I AM:

a) Generating Source Code for elnvoice EU standardb) Love to elaborate the collab idea with <u>YOU</u>!

No one can tell if LibreOffice is still en vogue in 50 years!

But the collaboration feature is critical!

Q&A anytime!
